EventOps

PLAN | COORDINATE | EXECUTE | TOGETHER

Turning Events into Experiences

More than events, better experiences.

ABSTRACT

EventOps is a web-based event operations and resource management platform designed to simplify the planning, coordination, and execution of events. The system provides a centralized platform for managing event details, teams, volunteers, resources, vendors, and tasks with role-based access control. Built using React, Spring Boot, MySQL, and JWT authentication, EventOps aims to improve collaboration, transparency, and efficiency in event management, making it suitable for college fests, workshops, conferences, and corporate events.

IDEA IN BRIEF

EventOps helps organizers manage everything that happens behind the scenes of an event — from creating the event and forming teams to assigning tasks, managing vendors, allocating resources, and tracking progress — all in one place.

One Platform Many Possibilities

> Organize smarter. Execute better.

PROJECT FLOW

1. **Event Creation** — Admin/Organizer creates an event with details, schedule and requirements.
2. **Team Formation** — Teams are created (e.g., Technical, Food, PR) and volunteers are assigned.
3. **Task Assignment** — Tasks are assigned to teams with deadlines and priorities.
4. **Resource & Vendor Management** — Manage venues, equipment, vendors and other resources.
5. **Execution & Tracking** — Track task progress, team updates and overall event status in real-time.
6. **Successful Event** — A well-coordinated event with complete reports and insights.

KEY FEATURES

- **Event Management** — Create and manage events with schedules and venues
- **Team & Volunteer Management** — Form teams, assign volunteers and roles
- **Task Tracking** — Assign, track and monitor tasks
- **Resource & Vendor Management** — Manage equipment, food, vendors and other resources
- **Analytics & Reports** — Real-time event progress and insights
- **Secure Access** — Role-based access with JWT authentication

TECHNOLOGY STACK

React — Frontend	**Spring Boot** — Backend	**MySQL** — Database
JWT — Authentication	**JPA / Hibernate** — ORM	**Git** — Version Control

EXPECTED OUTCOME

- A fully functional web application for end-to-end event operations.
- Improved coordination and transparency among event stakeholders.
- Efficient resource and task management.
- Scalable solution for academic and professional events.
- Enhanced event execution with real-time tracking and reporting.

KEYWORDS

Event Management · Resource Allocation · Task Tracking · Role-Based Access · JWT Authentication · Full Stack Development

Events today. Better tomorrow.
